

Assembler Flow V2 (Swimlanes by Owner)

Owner lanes: Collector / Contracts / Assembler / Template Owners

Collector

Emits bundle datasets in Inv.collector.dataset.v1 envelope
Path pattern: bundle/<id>/datasets/<tech>/<target>/<system>/<dataset>.json
Normalization should happen upstream for document-facing use

Contracts

mapping.dataset-to-sdt.v1.yaml = authoritative dataset->SDT bindings
assembler.projections.v1.json = table/list/scalar shaping
dataset/*.assembler.meta.json = presentation intent + preferred views

Assembler

Invoke-AssemblerBundleRender resolves placeholders and selects catalog entries
Invoke-AssemblerSdtRender applies selectors/renderHint/projectionRef
Populates tokens and emits render reports

Template Owners

Maintain SDT token locations in DOCX/TXT templates
Maintain docx doc map on templatePath/outputFileName
Validate rendered document readability and section intent

- Dataset content issue -> Collector lane first
- Wrong SDT binding/projection selection -> Contracts lane first
- Render mechanics issue -> Assembler lane (generic capability only)
- Token placement/output naming issue -> Template Owners lane
